ABSTRACT

VR Anatomy is a virtual reality-based platform designed to enhance anatomy education. Due to the complexity of the human body, traditional methods often fall short in supporting 3D visualization. The system enables interactive exploration of anatomical structures, enhancing understanding of anatomical relationships and making learning more effective.

SYSTEM ARCHITECTURE

System Features

The system consists of four main modules:

- AI Guided Learning:** Guided modules with labeled models and checkpoints
- Free Exploration:** Independent interaction with anatomical structures
- Chat With AI:** Text or voice-based questions and answers
- Quiz:** Timed questions with feedback and adaptive difficulty

Results

VR Anatomy enhances understanding of anatomical relationships through immersive 3D interaction. Users engage more actively and reinforce knowledge via quizzes and AI support. The system suggests that combining VR and AI can improve learning effectiveness and engagement.

Acknowledgement

We thank our advisors Assoc. Prof. Dr. Gül Tokdemir and Assist. Prof. Dr. Talha Karadeniz for their guidance, and Çankaya University for supporting this project. We also acknowledge our team members for their hard work and collaboration throughout the development process.
